

## RUSSEL

### **Representationalism:**

Subjective perception.

Percept which occur inside the mind.

You can never be sure as to if you are seeing an object.

There is something real happening, even if percept one has about it is incorrect.

One's percepts are private to themselves, no one sees what I do, I don't see what anyone else does.

As percept change event with slight modifications, it is impossible for two persons to have identical percepts at the same time.

One can never decide if something is farther than something else, as the vision they have doesn't readily tell it. They only can **infer** it. Ex: You can't percept whether a cloud or Jupiter is closer to you, you can only infer from your perception that Jupiter must be farther.
